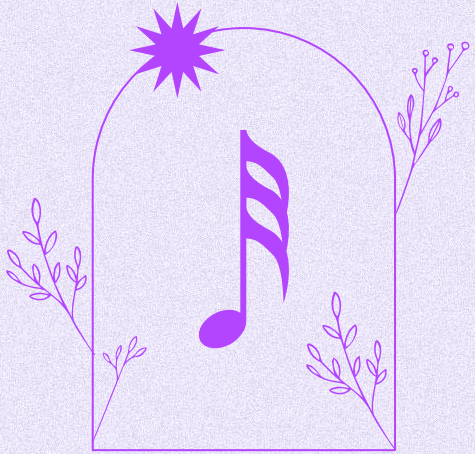
Motivation



- Difficulty levels for rhythm-based video games has not been studied in detail.
- Relevant research mainly applies to mainstream rhythm-based games such as *osu!*, *Stepmania*, and *Dance Dance Revolution*).
- Mobile rhythm games in particular lack much research.

Data Preprocessing & Feature Extraction

03

Song Features

What are they?

Features that that differ according to each song

Tempo (t)

BPM-derived tempo characteristics

ID	Jacket art	Song name	Producer(s)	Unit(s)	BPM	Duration (game-size)
1		Tell Your World	kz (livetune)	VIRTUAL SINGER	150	2:03
2		Roki	Mikito-P	Leo/need	150	1:47
3		Teo	Omoi Sakurai (lyricist)	Leo/need	185	1:56
6		HIBANA -Reloaded-	DECO*27 Rockwell (arranger) Mes (lyricist)	Leo/need	200	1:35
8		Time Machine	1640mP	Leo/need	126	2:04
10		Happy Synthesizer	EasyPop	MORE MORE JUMP!	127	2:13
11		Viva Happy	Mitchie M	MORE MORE JUMP!	148	1:34
13		Nostalogic	yuukiss	MORE MORE JUMP!	140	2:00

Score Features

What are they?

Features that differ according to each beatmap

Note Density (n)

Number of notes per second

Note Ratio for Beat Layer (l)

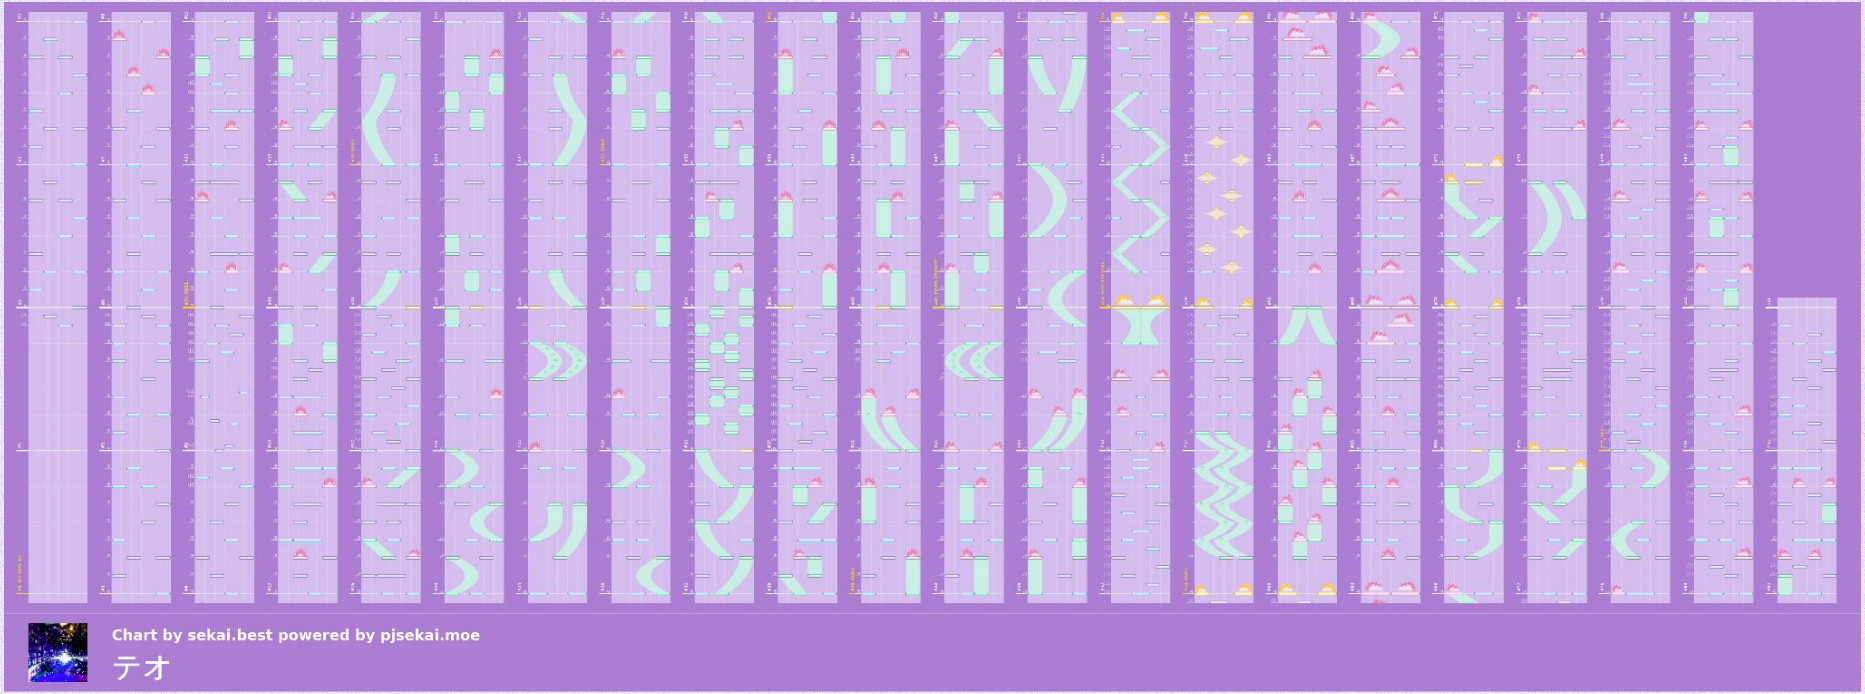
Corresponds to the complexity of a rhythm based on timing division such as ¼ or ⅛ notes

Size (s)

Total chart magnitude (number of total notes)

Algorithm

Step 1: Parsing



Class	Definition
bar-line	For bar counts in chart. About one per musical measure
beat-line	Lines for timings within each bar. Quarter notes in a musical measure
slide, slide-critical	Green slide notes, yellow slide notes
tick-line	Tick lines for note timing. Variable x1 is either 16 or 32

Step 1: Parsing

Hierarchy

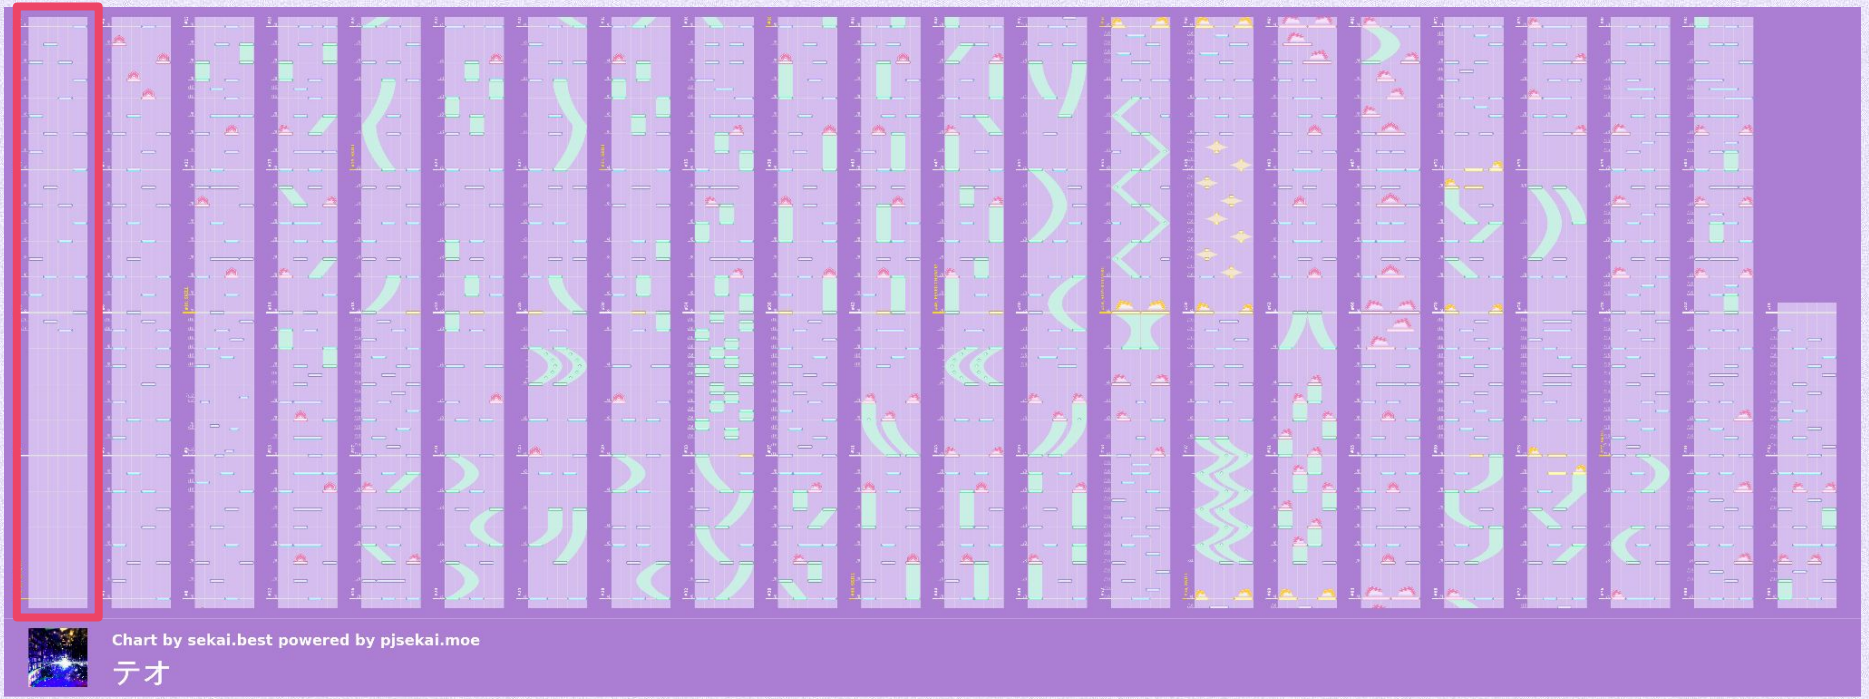
Lanes consist of several **bars** separated by a **#** and **bar lines**. Each **bar** contains **beat lines** and **tick-lines** corresponding to the note and tick timings of a chart.

Important Notes

- Doesn't contain classes for types of notes / playable notes.
- Only one type of playable note parsed: slides
- Bars are stacked on top of each other (different y-values, but the same x-values despite SVG's initial appearance).

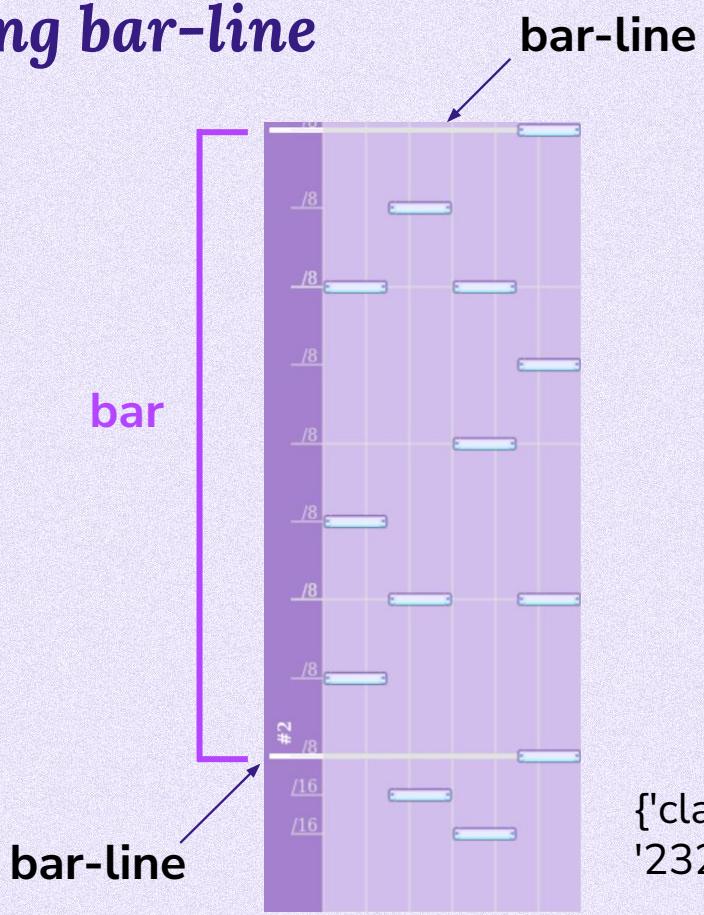
Step 1: Parsing

lane



Step 1a: Handling bar-line

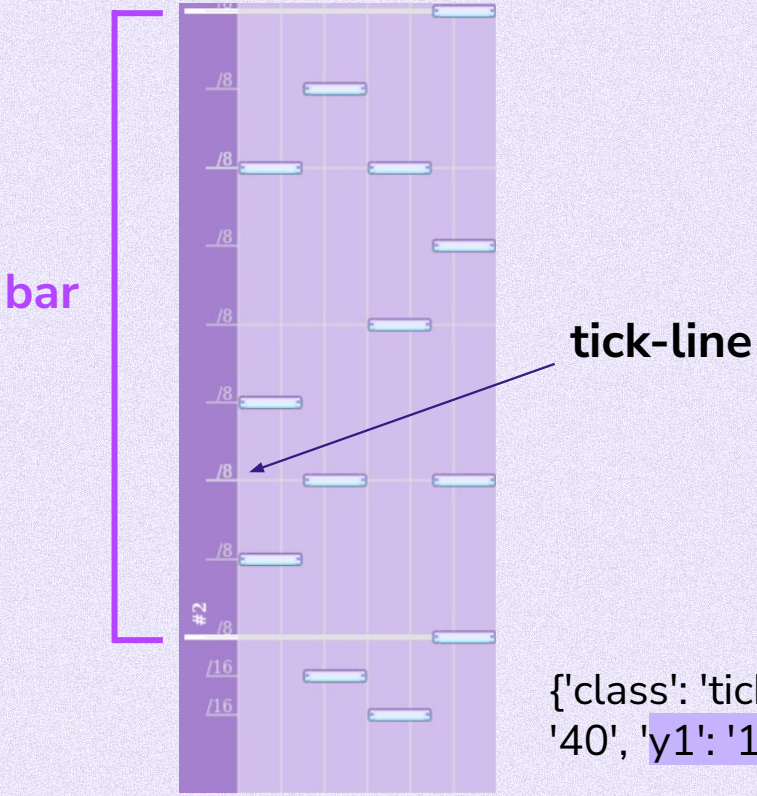
- Remove duplicate bar lines
- Sort and pair components as (top, bottom) bar boundaries
- Each pair represents a bar



{'class': 'beat-line', 'x1': '40', 'x2': '232', 'y1': '2505', 'y2': '2505'}

Step 1b: Handling tick-line

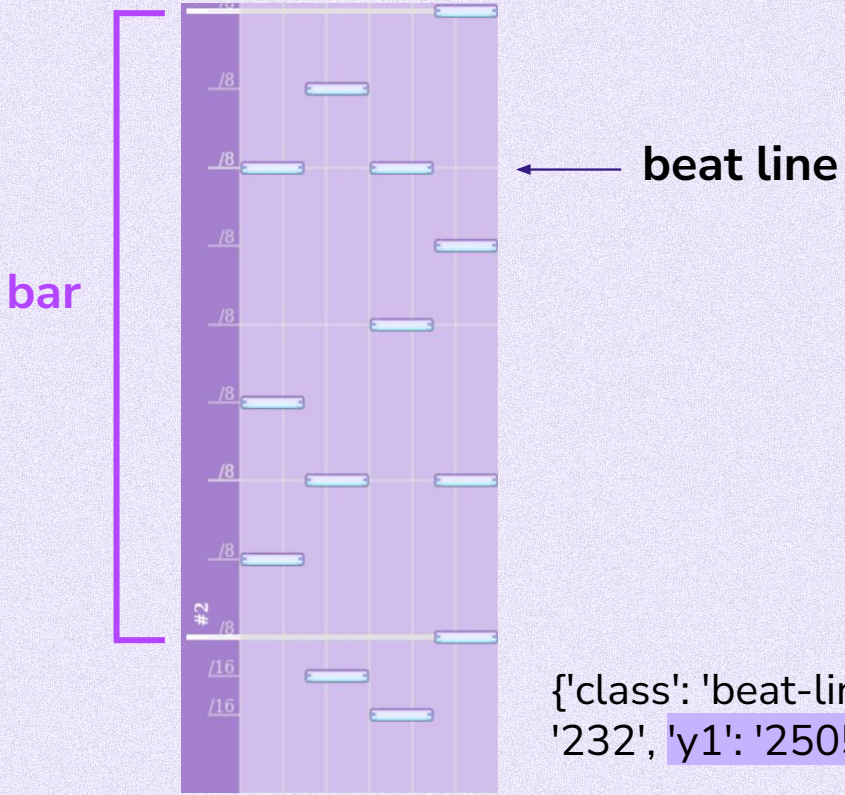
- Assign each note to a bar through the bar index
- For each note we look at its Y position (y1 or y2) and find the bar whose Y-range contains the note



{'class': 'tick-line', 'x1': '16', 'x2': '40', 'y1': '1024', 'y2': '1024'}

Step 1c: Handling beat-line

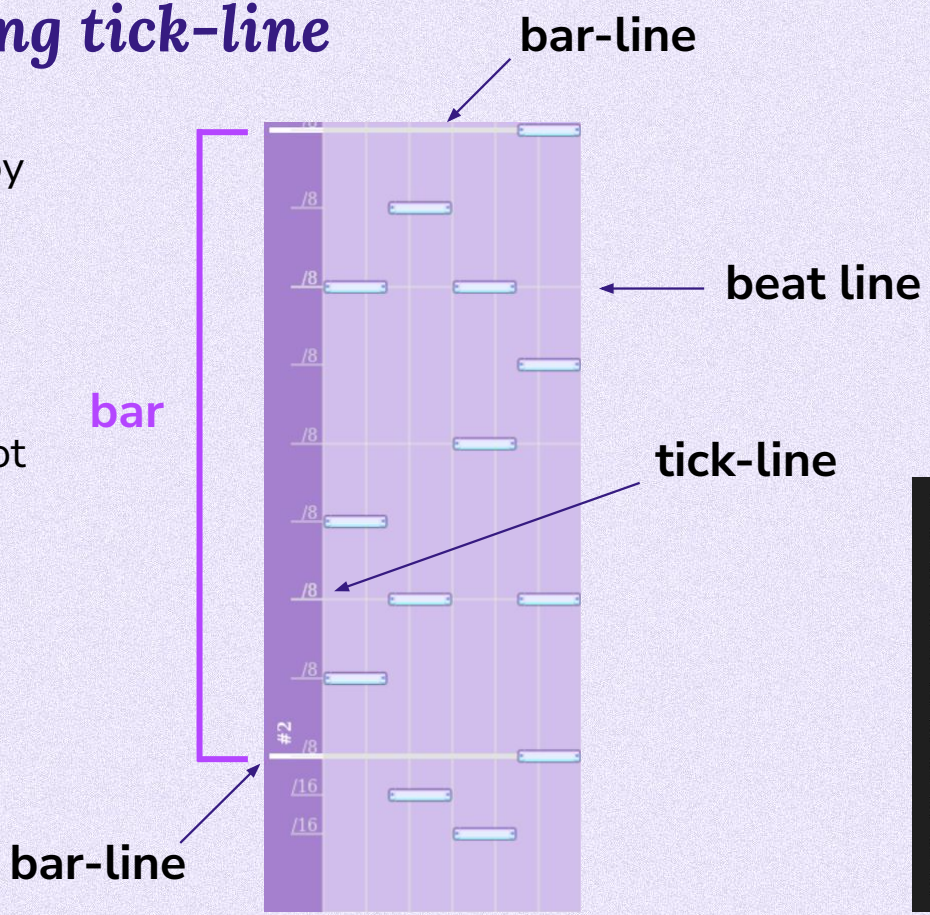
- We map beat lines to bars using bar midpoints



{'class': 'beat-line', 'x1': '40', 'x2': '232', 'y1': '2505', 'y2': '2505'}

Step 1d: Handling tick-line

- Assign each tick by calculating its fractional, relative positions within a beat segment.
- If beat lines are not available, we fallback to linear mapping.



```
songID,bpm,playback
1,150,2:03
2,150,1:47
3,185,1:56
6,200,1:35
8,126,2:04
10,127,2:13
11,148,1:34
13,140,2:00
15,130,1:46
18,185,2:08
```

Step 2: Feature Extraction

Create a synthetic beat grid (normalized timeline)

Initialization

Compute tempo features using BPM

Tempo (t)

Keep track of total notes in a chart

Total Notes/Scale (s)

Beat Layers (l)

Compute q-layer note ratios using the synthetic beat grid and timing divisions

Note Density (n)

Compute notes (ticks) per second using note times, song duration, etc.

Step 3: PCA and Clustering

Standardize Features

First, we standardize feature groups to reduce noise, scaling appropriately.

Apply PCA

We apply PCA per feature group. EX: PCA for note density $n_l, n_m, n_{mu}, n_{var}$ gives PC1: 87.6%, PC2: 9.9%, etc.

Combine PCs

We combine our selected PCs into a feature matrix for clustering.

Clustering

Lastly, we run KMeans clustering.

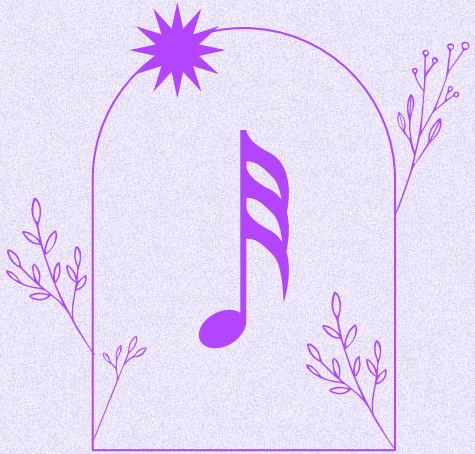
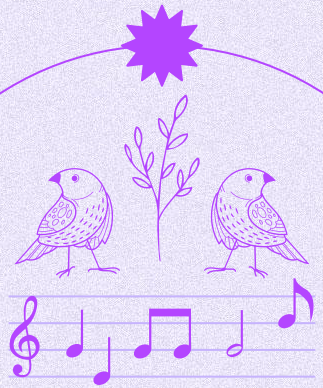
05

Conclusion

Conclusion



- Data analysis confirms that the designated features used for feature selection differed through the difficulty levels.
- High difficulty charts are mainly characterized by a large number of notes and a high note density, how fast a song is, and its beat layer ratios.
- Comparing our resulting results against the actual difficulty levels support our results and analysis.



Thank you!
